It currently
consists of 2 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence

                                                NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Daylor Plaza, Houston, TX 77030, USA

On May 10, 2003 this sequence version replaced gi:24818617.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.red/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html) NOTE: This sequence may represent more than one clone.

NOTE: This sequence may represent more than one clone.

NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces arbitrary. Gaps between the corder in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                   Submitted (17-SEP-2001) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Paylor Plaza, Houston, TX 77030, USA 3 (bases 1 to 259920).

Prostate disease marker UC Band #28.

19-APR-2000 (first entry)

N

```
The sequence represents nucleic acid biomarker UC band 28 #2, used in detection of prostate, breast and bladder cancer. Biomarker nucleic acid sequences can be used as hybridisation probes and primers that specifically hybridise to prostate cancer. benign prostatic hyperplasia (BPH), bladder cancer or breast cancer markers. Proteins encoded by the nucleic acid markers can be used to produce antibodies for the detection of prostate, breast or bladder cancer. The nucleic acids can be used as targets for therapeutic intervention in these diseases, in the identification and isolation of full-length gene sequences, including regulatory elements for gene expression, from genomic human DNA libraries, as hybridisation probes for screening genomic human DNA libraries. The kits comprising the nucleic acid sequences are useful for detecting bladder, breast or prostate cancer cells in a biological sample
                                                                                                                                                                                         New nucleic acids as biomarkers and targets useful for detecting, diagnosing, prognosing, and in developing treatments for prostate, breast and bladder cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 2087 BP; 740 A; 406 C; 337 G; 604 T; 0 U; 0 Other;

The invention provides nucleic acid markers of prostate, breast and bladder cancer. The markers are indicators of malignant transformation of prostate, breast and bladder tissues and are diagnostic of the potential also be used as targets for the repetit to the prostate cancer. The nucleic acid can also be used targets for therapeutic intervention in prostate cancer. The markers may be used to design specific probes and primers, for the rapid analysis of prostate, bladder or breast tancer. The primers may also be used for in situ hybridization or in situ PCR detection and diagnosis. They may also be used to identify and isolate full length gene sequences form various DNA libraries. Antibodies against the polypeptide products of the markers can be used to treat prostate to ancer, bladder cancer or breast cancer. The encoded proteins may be used to detect antibodies. The proteins and antibodies can be used in immunodetection methods for detecting or quantifying the cancers, and for clinical diagnosis of these cancers. The antibodies may also be used for calinical diagnosis of these cancers. The antibodies may also be used for calinical diagnosis of these cancers. The antibodies may also be used for calinical diagnosis of these cancers. The antibodies may also be used for calinical diagnosis of these cancers. The antibodies may also be used for calinical diagnosis of these cancers. The antibodies may also be used for calinical diagnosis of these cancers. 218 Novel RNA biomarkers for diagnosis, prognosis and management of prostate, 20 21 GlnIleArgLysLeuArgHisArgLeuSerAsnPheProArgLeuProGlyIleLeuAla 40 ProGluThrValLeuLeuProPheCysTyrLysValPheArgLysLysGluLysValLys 60 CAGATCAGAAAATTGAGGCACAGATTAAGTAACTTCCCCAAGGCTACCAGGCATCTAGCT 1 MetArgAlaPheLeuArgAsnGlnLysTyrGluAspMetHisAsnIleIleHisIleLeu Sequence 2088 BP; 740 A; 406 C; 337 G; 604 T; 0 U; 1 Other; radioimaging to quantify and localize the encoded proteins Length: Matches: Conservative: Mismatches: Indels: US-09-974-546C-84 (1-135) x AAZ87583 (1-2088) Veltri RW; Claim 1; Page 182-183; 191pp; English 98US-00097199 O'hara SM, Ralph D, 2.6e-76 694.00 100.00% 100.00% breast and bladder cancer. 2000-116557/10. Biomarker nucleic acid sequences can be used as hybridisation probes and primers that specifically hybridise to prostate cancer, benign prostatic hyperplasia (BPH), bladder cancer or breast cancer markers. Proteins encoded by the nucleic acid markers can be used to produce antibodies for the detection of prostate, breast or bladder cancer. The nucleic acids can be used as targets for therapeutic intervention in these diseases, in the identification and isolation of full-length gene sequences, including regulatory elements for gene expression, from genomic human DNA libraries, as hybridisation probes for screening genomic human DNA libraries. The kits comprising the nucleic acid sequences are useful for

The invention provides nucleic acid markers of prostate, breast and bladder cancer. The markers are indicators of malignant transformation of prostate, breast and bladder tissues and are diagnostic of the potential for metastatic spread of malignant prostate tumours. The nucleic acid can also be used as targets for therapeutic intervention in prostate cancer, benign prostatic hyperplasia (BPH), bladder cancer or breast cancer. The markers may be used to design specific probes and primers, for the rapid primers may also be used for in situ hybridization or in situ PCR detection and diagnosis. They may also be used to identify and isolate fill length gene sequences form various DNA libraries. Antibodies against the polypeptide products of the markers can be used to treat prostate cancer, bladder cancer or breast cancer. The encoded proteins may be used to detect antibodies. The proteins and antibodies can be used in immunodetection methods for defecting or quantifying the cancers, and for immunodetection methods for defecting or quantifying the cancers, and for calinical diagnosis of these cancers. The encoded proteins

Bacterial polynucleotide #20398

02-DEC-2004 (first entry)

ADT45647 standard; cDNA; 1113 BP

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypoptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant to such as maize or soybean. The method of producing a transformed plant with the crecombinant DNA construct and growing the transformed plant with the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with the polynucleotide or polypeptide is useful for improving plants with the comprant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the content, improved plant growth and development under at least one stress condition, improved lignin production of carbohydrate, introgen or phosphorus use and/or uptake, by modification of photosynthesis or by production. This sequence represents a bacterial polynucleotide used in the scope of the invention. Note: The sequence data for this patent did content from part of the printed specification but was obtained in electronic form part of the parinted specification but was obtained in electronic form part of the patinted specification but was obtained in electronic format from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 ATGCACAACTTA-----GCCATAAAGCTGAGAGAAAGAGGGGATGAAGTGGGAATAGTC 114
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13 MetHisAsnIleIleHisIleLeuGlnIleArgLysLeuArgHisArgLeu-----

transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transformed a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant with the polynucleotide or polypeptide is useful for producing plant properties.

The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan the secope of the invention. Note: The sequence data for this patent did content form part of the printed specification but was obtained in electronic format from USPTO at sequence. The sequence was obtained in electronic format from USPTO at sequence.html.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1626 GGTCAAGAATAGCCATCAAATATTGCTCATACGACGTGTTGTACATGCGATTAGTGTAGG 1685
                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```

The invention relates to methods, agents and apparatus for diagnosing and prognosing vascular diseases based on the detection of polymorphisms in the phospholipase C gamma 1 (PLGGI) and plasminogen activator inhibitor type 2 (PAI-2) genes and polypeptides. In a preferred claim of the invention the polymorphism is a C to T nucleotide change at position

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus facealis genome. AAX13919 to AAX13919 represent these nucleotide sequences which are primary nucleotide sequences. Also known as contigs. The computer-based system can identify fragments of the Enterococcus facealis genome with commercial importance. The products can be used to detect the presence of Enterococcus facealis in samples. They can also be used for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated Enterococcus faecalis polynucleotides and polypeptides - used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus infection.
       acid change from Threatone to Isoleucine at position 813 of the protein. This sequence represents the region of the PLCG1 gene with the T form of the polymorphism. The methods, agents and apparatus is used for diagnosiming and prognosimal vaccular diseases e.g. atherosclerosis, coronary artery disease (especially), myocardial infarction (especially), ischemia, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism
                                                                                                                                                                                                                                                                                                                                                                      16 IlelleHislleLeuGlnIleArgLysLeuArgHisArgLeuSerAsnPheProArgLeu 35

Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nuclectide sequences can be used in vaccines to prevent or attenuate an Enterococcal infection
                                                                                                                                                                                                                                                                                                                                                                                                      22
                                                                                                                                                                                                                                                                                                                                                                                                                                                               72

                                                                                                                                                                                                                            The present invention relates to a new computer readable medium with an diagnose the presence of B. faecalis in a sample or determining the presence of B. faecalis in a sample or determining the presence of a specific microbe in a sample. The invention is also useful for modulating the growth or pathogenicity of B. faecalis, in a vaccine to confer resistance to Enterococcal infection, for commercial, therapeutic and industrial purposes, and for fermenting a particular source or to produce a particular metabolite. The invention is useful for detecting diseases related to Enterococcus infections in animals, and for detecting E. faecalis using biochip technology. The present nucleic acid sequence represents an Enterococcus faecalis contig DNA sequence of the invention. Note: The sequence data for this parent did not form part of the printed specification but was obtained in electronic format directly from USPTO
